What is an umbilical granuloma?

An umbilical granuloma is an overgrowth of tissue during the healing process of the belly button (umbilicus). It usually looks like a soft pink or red lump and often is wet or leaks small amounts of clear or yellow fluid. It is most common in the first few weeks of a baby's life. The overgrowth of tissue is relatively common and is not dangerous but does need care.

General care of the umbilicus/belly button

- Keep the belly button clean and dry
- Cleanse belly button with soap and warm boiled water if it gets soiled with urine or faeces
- Expose the belly button to the air by rolling back the top of the nappy when the opportunity allows

How is an umbilical granuloma treated?

If there is an umbilical granuloma and no obvious infection, then your GP or health visitor may suggest salt treatment. This has been found to be a very effective and safe treatment, which you can do at home.

If the salt treatment is not effective occasionally silver nitrate treatment will be suggested. This has to be done by the GP.

How to do the salt treatment

Wash and clean your hands or use plastic gloves prior to starting the procedures outlined below

- Apply a small pinch of table or cooking salt onto the umbilical granuloma. If you are unsure ask your health visitor to show you how much is required.
- Cover the area with a gauze dressing 'swab' and hold in place for 10 -30 minutes. This may be easiest to do when your baby is asleep.
- Now clean the site using a clean gauze dressing soaked in warm boiled water.
- You should repeat the procedure twice a day for at least two days.

In approximately two or three days you should notice that the granuloma reduces in size, possibly changing colour as it dries off and gradually heals.

What to do if the salt treatment is not effective or an infection is suspected

If the umbilical granuloma does not respond to treatment after one week, see your GP or health visitor. The health professional will consider the need for further treatment.

If your baby's belly button is showing signs of infection such as redness of the surrounding skin or possibly having an offensive smell and discharge or your baby has a fever, contact your GP for an appointment as soon as possible.
